Dear Hiring Team,

Ramp's commitment to high agency, urgency, and shipping infrastructure that manages billions in business spend requires engineers who are fundamentally practical builders. I am applying for the Applied AI Engineer role because I thrive at the exact intersection Ramp operates in: taking advanced LLM capabilities out of the research phase and integrating them into highly scalable, production-ready web platforms.

With over 6 years of professional experience as a Full-Stack Software Engineer, I know how to ship code to production in high-stakes, data-dense environments. At Charity Navigator, I contributed to the delivery of a React and TypeScript data portal that scaled to support over 50,000 clients and sustained traffic spikes of 700,000 concurrent visitors. I assisted in complex data integrations via GraphQL and collaborated directly with product teams to drive operational excellence. Later, at NAMI, I focused on developer productivity by building automated Cypress testing pipelines and centralized UI component libraries to scale our engineering efforts.

Recently, I have focused my independent R&D deeply on applying LLMs to real-world problems. I architected an advanced multi-agent ecosystem using the OpenClaw framework, designing a system that utilizes a hybrid inference strategy—intelligently routing deep reasoning tasks to Google Gemini Pro and local Gemma 27b models, while optimizing latency by sending lightweight parsing tasks to Gemma 4b. To solve for structured extraction and state management, I built autonomous Python ETL pipelines backed by SQLite to ensure durable memory across agent workflows. I don't just prototype; I build the practical scaffolding (like secure API integrations and HITL terminal approvals) that makes LLMs actually useful.

What sets me apart is my non-traditional background. Before engineering, I earned a Master's degree in Counseling. This foundation makes me deeply collaborative and communicative. I don't just write code in a silo; I work alongside stakeholders to ensure the tools we build actually solve the underlying human and business problems.

I combine the rigorous production experience of a full-stack engineer, a strong collaborative background, and a deep obsession for applied AI. I am eager to bring my high-agency mindset to Ramp to help build tools that make finance teams infinitely more productive.

Thank you for your time and consideration. I would welcome the opportunity to discuss how my background aligns with your engineering goals.

Best regards,

Tyler Stahl
